Master Course – High Performance Computing

Introduction to the Message Passing Interface (MPI)

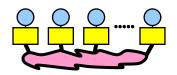

Collective Communication

Dr. Juraj Kardos, Prof. Olaf Schenk (TA: Tim Holt, Aryan Eftekhari)

Faculty of Informatics
USI Lugano, Switzerland
November 11, 2020

Chap. 5 Collective Communication

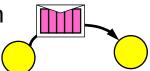

- MPI Overview
 - one program on several processors work and data distribution

- 2. Process model and language bindings
 - starting several MPI processes

MPI_Init() MPI_Comm_rank()

- 3. Messages and point-to-point communication
 - the MPI processes can communicate

- 4. Non-blocking communication
 - to avoid idle time and deadlocks

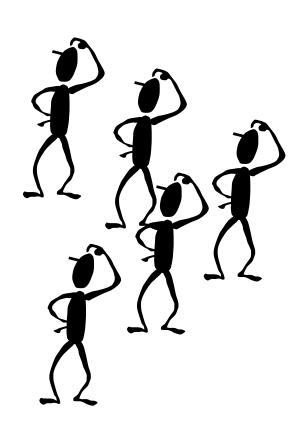

- 5. Collective communication
 - e.g., broadcast

Broadcast

A one-to-many communication.

Collective Communication

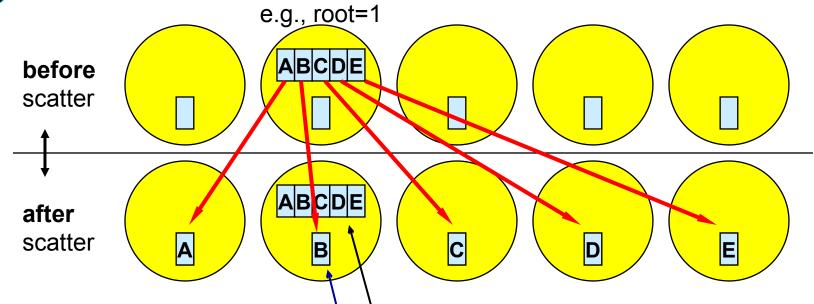

- Communications involving a group of processes.
- Called by all processes in a communicator.
- Examples:
 - Broadcast, scatter, gather.
 - Global sum, global maximum, etc.

Broadcast

• C: int MPI_Bcast(void *buf, int count, MPI_Datatype datatype, int root, **MPI_Comm** comm) before r e d bcast after red r e d red r e d r e d bcast e.g., root=1 rank of the sending process (i.e., root process)

must be given identically by all processes

Scatter

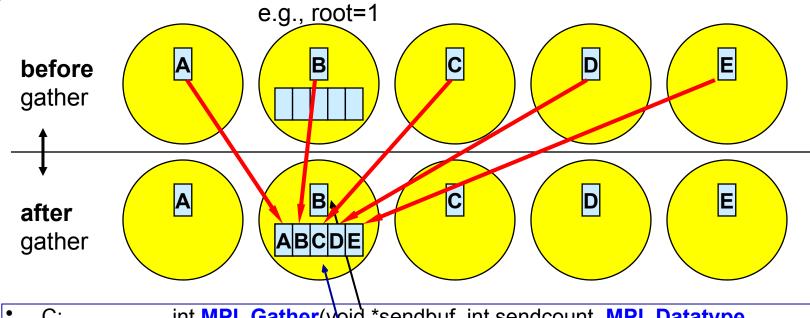

C: int MPI_Scatter(void *sendbuf, int sendcount, MPI_Datatype sendtype, void *recvbuf, int recvcount, MPI_Datatype recvtype, int root, MPI_Comm comm)

Example:

MPI_Scatter(sbuf, 1, MPI_CHAR, *rbuf*, 1, MPI_CHAR, 1, MPI_COMM_WORLD)

Gather

C: int MPI_Gather(void *sendbuf, int sendcount, MPI_Datatype sendtype, void *recvbuf, int recvcount, MPI_Datatype recvtype, int root, MPI_Comm comm)

Global Reduction Operations

- To perform a global reduce operation across all members of a group.
- d₀ o d₁ o d₂ o d₃ o ... o d_{s-2} o d_{s-1}
 - d_i = data in process rank i
 - single variable, or
 - vector
 - o = associative operation
 - Example:
 - global sum or product
 - global maximum or minimum
 - global user-defined operation
- floating point rounding may depend on usage of associative law:
 - $[(d_0 \circ d_1) \circ (d_2 \circ d_3)] \circ [\dots \circ (d_{s-2} \circ d_{s-1})]$
 - $(((((((d_0 \circ d_1) \circ d_2) \circ d_3) \circ \dots) \circ d_{s-2}) \circ d_{s-1})$

Example of Global Reduction

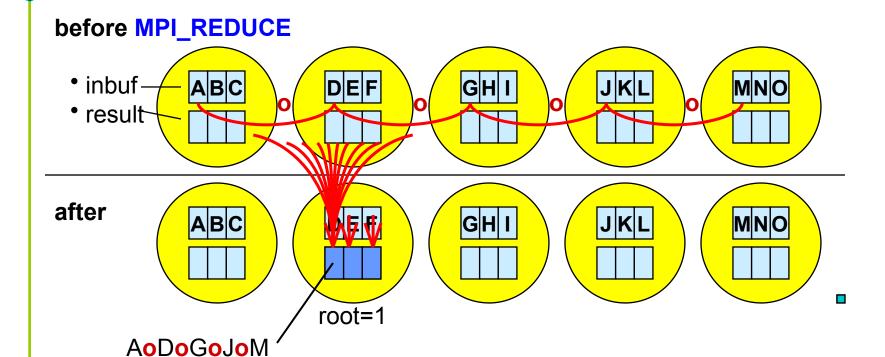

- Global integer sum.
- Sum of all inbuf values should be returned in resultbuf.
- C: int root=0

 MPI_Reduce(&inbuf, &resultbuf, 1, MPI_INT, MPI_SUM, root, MPI_COMM_WORLD);
- The result is only placed in resultbuf at the root process.

Predefined Reduction Operation Handles

Predefined operation handle	Function
MPI_MAX	Maximum
MPI_MIN	Minimum
MPI_SUM	Sum
MPI_PROD	Product
MPI_LAND	Logical AND
MPI_BAND	Bitwise AND
MPI_LOR	Logical OR
MPI_BOR	Bitwise OR
MPI_LXOR	Logical exclusive OR
MPI_BXOR	Bitwise exclusive OR
MPI_MAXLOC	Maximum and location of the maximum
MPI_MINLOC	Minimum and location of the minimum

MPI_REDUCE

Variants of Reduction Operations

MPI_ALLREDUCE

- no root,
- returns the result in all processes

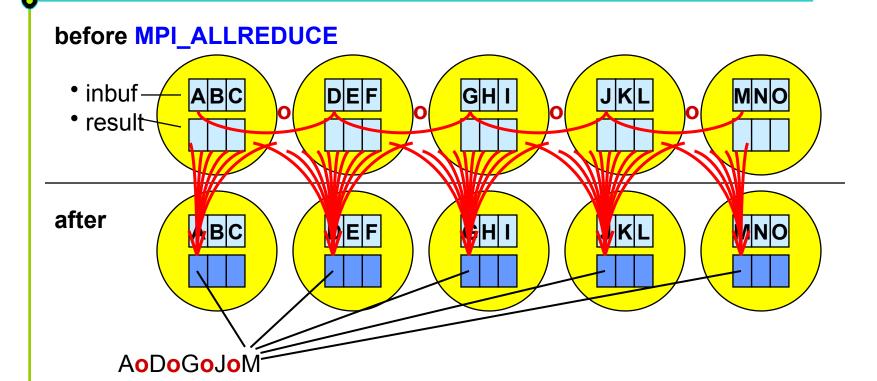

MPI_SCAN

- prefix reduction
- result at process with rank i := reduction of inbuf-values from rank 0 to rank i

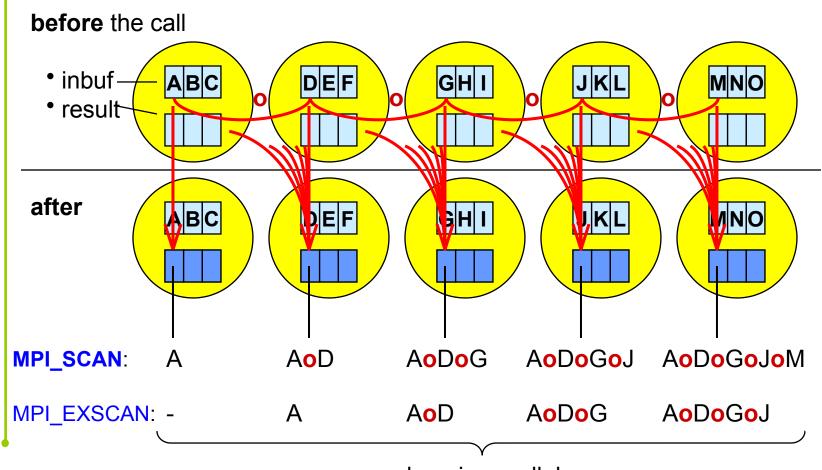

MPI_EXSCAN

result at process with rank i := reduction of inbuf-values from rank 0 to rank i-1

MPI_ALLREDUCE

MPI_SCAN and MPI_EXSCAN

done in parallel

In Class Exercise: PI

- You are given the code template, that calculates PI value in pi.c.
- The PI value is calculated by numerically solving the integral of arctangent
 - Each process calculates approximate area of its part of integral
 - In the end, partial results shall be summed together
- Use MPI reduction call to collect the grand total integral sum on one rank
- Print out the resulting approximation of PI value

In Class Exercise: Pl

show solution pi.c
